Whole spike with awns trimmed, white, green and yellow anther were collected and total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthesized from mRNA using a priner consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plasmids with cDNA inserts. Blue colonies 9n-15) have been sequenced, and possess putative cDNA inserts. This library was constructed by Dr. Paul Keim & Virginia H. Coryell, Department of Biology, Box5640, Northern Arizona University, Flagstaff, Az 86011, Phone: 520-523-1078 (Dr. Paul Keim), 520-523-1372 (Virginia H. Coryell), Fax: 520-523-7500, email: paul.keim@nau.edu, virginia.coryell@nau.edu"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and phosphorylated. The XhoI site within the first-strand synthesis primer was restricted by digestion with XhoI; all XhoI sites in the CDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using GibcoBRL Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been digested with ECORI and XhoI, and phosphorylated). Both the white and blue colonies appear to contain recombinant the white and blue colonies appear to contain recombinant

/note="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: EcoRI; Site_2: XhoI; Plants were grown to seed
maturity under conditions favoring seed dormancy (L.
Dohery at K. Walker_Simmons lab, Washington State
University, Pullman, WA). Embryos were cut from mature
dormant seed (Doherty). Total RNA was prepared from these
embryos, polyA was purified, a cDNA library was made, and
the cDNA clones were in vivo excised to give pBluescript
phagemids in the TJ Close lab at the University of
California, Riverside (Chin, Fenton). Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               were grown in a growth chamber using germination paper. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gloco BRJ). This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from 2 week old seedlings with the cotyledons removed at the time of harvest. The seedlings for the cultivar Raiden

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC cligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 5'-end CC oligonucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a composition of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primers sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB45893 represent human amino acid sequences; and AAH13629 to AAH13620 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  29-JUL-1999;

antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus

The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary, antiposciatic appropriations.

      The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAW42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide in gene therapy be used to treat diseases of the peripheral nervous of the invention may be used to treat diseases of the peripheral nervous

                                                                                                                                                                                                                                                                                                                                                                                                                                             to CCYPR may be used in enzyme-linked immunosorbent assays (ELISA) or radioimmunosasys to detect CCYPR. CCYPR itself may be used to detect Ccompounds e.g., antibodies, oligonucleotides and proteins (receptors) that specifically bind to CCYPR, and in drug screening methods to Ccypr identify compounds that modulate the activity of CCYPR. CCYPR concleotides can be used to generate transgenic animal models of human concleotides and can be used in gene therapy in target cells with genetic abnormalities with respect to the expression of CCYPR for the treatment or prevention of a disorder associated with CCYPR. CCYPR concleotions, nucleic acids, agonists or antagonists include immune, conclude immune, conclude including cancer. Specific examples of these disorders including cancer. Specific examples of these disorders, allergies, attention of the proteins, and cell signalling disorders.

                                                                                                                                                                                                                                                                                                                                                                                                        AAX30145 to AAX30173 represent 29 isolated human secreted protein genes. AAY04291 to AAY04321 represent the secreted proteins encoded by the 29 cc human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, cc e.g. by protein or gene therapy. Also pathological conditions can be cc diagnosed by determining the amount of the new polypeptides in a sample cc uses are described for each of the 29 genes, based on which tissues they care most highly expressed in, and include developing products for the cd diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, cd disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney cd disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney cd disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney cd disorders, digestive/endocrine disorders, infections and ALDS. The polypeptides are also useful for identifying their binding partners. The cused in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                     compounds binding to it and acting as agonists or antagonists, which are potentially useful for the treatment and prevention of cancer and other cell proliferation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              containing a bromo domain. The factor interacts with proteins involved in the chromatin-mediated transcription regulatory mechanism. It binds to hSNF2H, hSNF2L and NCOA-62/Skip. It can be used for screening

The factor interacts with proteins involved in the chromatin-mediated transcription regulatory mechanism. It binds to hswr2H, hswr2L and NCOA-62/Skip. It can be used for screening compounds binding to it and acting as agonists or antagonists, which are potentially useful for the treatment and prevention of cancer and

                                                                                                                                                                                                                                                                                                                                                       dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobblisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of the cardiovascular disorders and the exemplification of the cardiovascular disorders and the exemplification of the cardiovascular disorders.
                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antiinflammatory; antithyroid; antiallergic; antibacterial; antiviral;

                                                 The invention provides nucleic acids encoding the human and murine death inducer-obliterator 1 (DIO-1) polypeptides. The polypeptides can be expressed by standard recombinant methodology. The DIO-1 polypeptides, agonists and antagonists are used as a medicament for treating diseases characterized by an alteration in cell death or by hyperproliferation, e.g. cancer, autoimmune diseases, diabetes, rheumatoid arthritis, benign e.g. cancer, autoimmune diseases, diabetes, rheumatoid arthritis, benign tumours, malignant tumours or hyperproliferative skin disorders. They are
